Note, there's some confusion in the comments so far -- 10 bit is a professional display, and is extremely uncommon..) How much software fully supports the 10-bit Eizo or NEC displays on Windows these days? Do typical GPUs now support 10-bit color, or is it still only expensive workstation GPUs? My impression was that only a few niche applications have bothered (notably, Photoshop has had support for a few years), since 10-bit displays are so rare/expensive, but I'm not an expert.

And they're essential for containing a wider range of possible values, letting pro cameras represent a wider dynamic range than is possible in 8 bit systems.. Some crappy screens on consumer electronics can't even represent the full 8 bits per channel; 6 bits + dithering is sadly really common, even in screens that advertise themselves as 8/24-bit.. The OS simply wouldn't support 10-bit display I know you could get it in Windows, and almost certainly in Linux with the correct voodoo.

And 8 bits is more typical -- it's literally baked into many file formats, like JPEG.. Pro cameras and software can usually handle higher bit depths -- 16 for DSLRs, 10-12+ for pro video cameras -- but you're probably not seeing it unless you've carefully set up your computer..  The Flame UI model with more timeline-based effects than Smoke 2013 IMac line and the addition of a 13" MacBook Pro with Retina display,.. Also, color depth can be reported both in bits-per-channel and total bit depth; a 10 bit-per-channel display is 30 bits of color information per RGB pixel, 10 each for red, green, and blue.. Until I realized it was really 5 bits per channel, which is roughly bad-ATM-screen quality.. My post guys wanted to stay on the Mac platform, so we dealt with 8-bit displays (color wasn't a huge part of our workflow -- but 10 bit would've been nice). [December 29th, 2017](#)

(Some of the confusion is probably intentional; I had a hardware partner brag about their '15 bit display,' which sounded very weird to me.. Those bits are still useful: they're the raw material for generating your 8-bit final image, so you don't get banding when adjusting color or exposure..
